

# RETINAL PHOTOGRAPHY

A routine part of every eye examination involves looking inside your eyes with the ophthalmoscope (the bright light). In order to see better, many eye doctors choose to **add drops** or **dilate** your eyes. Unfortunately, this blurs your vision for several hours and makes driving difficult.

Our doctors choose, instead, to take a digital photograph of the inside of your eyes and avoid having to add drops or dilate your eyes. This is done by using the state of the art Kowa Digital Imaging System. The resulting photograph allows us to see the inside parts of your eyes that are not easily visible with normal instruments. The photograph will also be used in the future to compare and determine if there are any changes in the health of your eyes. So for the continued health of your eyes, our doctors highly recommend that we add this to your permanent health records here.

There is a \$20.00 charge for this digital photo documentation and is not generally covered by your insurance.

Normal Eye

- Yes, I want this procedure performed.
- No, I do not want this procedure performed.
